

## INTEGRATED CONTAINER AND INFUSER APPARATUS

### Abstract of the Disclosure

The present invention is a convenient, aesthetically pleasing, multi-purpose container/beverage infuser that allows a user to store and brew beverages such as tea.

5      The device includes a base container for storing the loose tea leaves prior to brewing. A lid is provided to seal the container so that the tea leaves may be preserved during storage. An infuser is removably attached to the base container. The infuser is shaped so that it may be inverted over a drinking container and receive a predetermined amount of fresh tea leaves to be steeped. Clips are coupled to the

10     infuser so that the infuser may be retained in the inverted position over the drinking container during the brewing process. A cap is placed on top of the infuser when assembled and may be invertedly placed on a stable surface to hold the infuser after use to prevent excess dripping.
